

MULTI-POINT SEAT BELT

*Sub
Spec
ANB*

CROSS REFERENCE TO RELATED APPLICATIONS

This is a divisional continuation-in-part application of the US-serial number 09/554,463
related to an international application number PCT/DE98/03270 (WO 99/24294, European
Patent EP 1 037 773 B1, German Patent DE 197 49 780 C2) filed Nov. 10, 1998.

BACKGROUND OF THE INVENTION

1. Field of the Invention:

It is an object of the present invention to ensure the restraint of passengers of a transport system, while preserving the user-friendliness, and to lower all acceleration-dependent forces imposed on them in order to enhance the survival chance in the event of any accident (front-, side-, rear-end collision and/or rollover or pile up/mass collision) or during in-flight turbulence.

~~It is an object of the present invention to ensure the restraint of a passenger in order to enhance the survival chance associated with lowering all acceleration dependant forces in the event of any accident (front, side, rear-end collision and/or rollover or pile up/mass collision) of a transport system (a motor vehicle, a train or an aeroplane) or during turbulence related vibrations of an aeroplane.~~

2. Discussion of the Prior Art:

- It is known in the prior art to provide for a passenger of a transport system
- a three-point seat belt (safety belt or lap-shoulder seat belt assembly), mounted in the motor vehicle, consisting of a shoulder belt extending across the upper body-part of his body and of a lap belt extending across the lower body-part of his body; or
 - a two-point seat belt, mounted in the aeroplane, acting as a lap belt extending across the lower body-part of his body; or
 - a suspender- (waist-) belt consisting of several pieces (belt-members).

In order to formulate in single terminology a generalized definition is presented for the proper term:

Definition:

Proper Term:

" <u>Transport system</u> "	<u>Motor vehicle or train or ship or aeroplane</u>
" <u>Stiff first transport-system member</u> "	<u>Floor 6 of the transport system adjacent to a first seat-side SR (Fig. 1) or seat-cushion frame at the first seat-side or mid-tunnel (not drawn) of the motor vehicle adjacent to the first seat-side.</u>
" <u>Stiff second transport-system member</u> "	<u>Floor 6 of the transport system adjacent to a second seat-side SL or seat-cushion frame at the second seat-side or post section 91 (Figs. 13, 14) of the motor vehicle adjacent to the second seat-side or side rail of the motor vehicle adjacent to the second seat-side</u>
" <u>Stiff third transport-system member</u> "	<u>Floor 6 of the transport system adjacent to the second seat-side or seat-backrest frame at the second seat-side or post section adjacent to the second seat-side.</u>
" <u>Shoulder-belt deflector</u> "	<u>Belt deflector 5, 5b or D-ring 12 (Figs. 1, 13)</u>

It is well known to provide different restraint systems in vehicles, predominantly, three-point seat belts in various types for seats, exemplified by DE 37 41 831 A1 shown in Fig. 11.

Evidently, when both shoulders of a passenger, conventionally belted, are not restrained in the event of an arbitrary collision with another vehicle in any direction, shown in Figs. 3, 4 and 7, the unrestrained shoulder can always move and/or rotate freely, thereby resulting in severe/fatal injuries in real-world accidents when

- the head crashes into the steering wheel and/or window pane and/or
- the airbag crushes the head, which, loaded by the forces related to pitch-acceleration \ddot{U}_H , yaw-acceleration \ddot{O} , longitudinal and/or lateral acceleration, is in "oop" (out of position).

Moreover, by the definition of „submarining“ the belted passenger submarines (slips downward) under his seat belt thus negating the protective effect of the seat belt.

It is well known to provide two-point or lap seat belts for aeroplane seats as well as mid-portion of the rear seats of motor vehicles. This lap seat belt is far less effective than a three-point seat belt. Due to very large accelerations during a turbulence-related flight the protective effect is very low.

A substantially improved protection is proposed by two different configurations of a one-piece seat belt, exemplified by DE 26 02 875 A1 (Figs. 8 to 10). An „X-shaped” restraint is arranged by extending both shoulder belts crosswise over the upper body-part of body while the lower body-part of body is restrained by the lap belt. Each end of the one-piece seat belt is connected to a belt retractor, fastened in the seat backrest. Two grab rings, positioned to the headrest, move along the belt. A single or double „X-shaped” configuration is defined by pulling a pair of grab rings and belt portions over the head, shoulders and head rest and engaging them in the corresponding hooks. Due to such intricate operation the seat belt remains unused.

According to US 3,977,696, US 5,123,673, US 5,411,319, DE-OS 23 45 847, DE-OS 28 13 888 and DE 196 29 878 A1 the restraint system comprises a three-point seat belt, a second shoulder belt and two belt retractors, responsible for retracting both belts. The „X-shaped” configuration, formed by extending both belts crosswise over the upper body-part of the body, has the following drawbacks in the event of an accident:

D1. Both belts are retracted to different length by two independently operating belt retractors within milliseconds.

D2. Under the load of the same belt force in a front collision the deformation of seat backrest, wherein both belt ends are fastened, is larger, thus increasing the forward motion.

Furthermore, it is impossible to attach an energy absorber because all four belt ends are occupied.

D3. Exemplified in US 5,123,673, the belt user has to depress two release buttons to release the respective main latch plates 9 from the main buckle assemblies. This two-click operation causes discomfort and hinders rescue work. See countermeasures by means of a single master release button, mentioned below.

A one-piece seat belt 1 (Fig. 1) ref. to DE-OS 28 13 888 is equipped with two belt retractors (not drawn), fastened to both belt ends in the seat backrest, and a belt deflector 17, anchored to the seat-cushion frame 3.3 of the mid-portion of rear seat. The feature, proposed for a child, has the following drawbacks:

D34. When the release button 84 is depressed, the first shoulder belt portion 1.1 gets entangled around the neck of passenger. For the operation of restraining and extending both belt portions into the „X-shaped” configuration, the passenger must lower his head first.

D45. Because all belt ends are occupied, it is impossible to attach energy absorbers and to adjust the belt to the size of an upper body-part of body 95 of an adult.

Generally, a child-seat is fastened by four auxiliary belts to the seat. Despite the „X-shaped” configuration of a one-piece seat belt to restrain a child, sitting in a child-seat, ref. to FR 2 342 872 A1 the problems, associated with the retraction of four auxiliary belts, submarining and energy absorption, remain unsolved in an accident.

Till now, trains, school buses and buses are not provided with restraint systems.

SUMMARY OF THE INVENTION

Accordingly, the principle object of the present invention is to provide for passengers of a transport system seat belts, each equipped with a belt retractor, solely responsible for retraction, blocking and tightening or for protraction, a lower belt deflector to loosely guide a belt portion and multi-attachment points (multi-points of restraint), and to restrains a every passenger in multi-attachment points, in order to lower and distribute the acceleration-dependent loads, shown in **Fig. 3** and **Tables 1 to 3**, to the multi-attachment points in the event of any accident ~~thereof or during in-flight turbulence-related vibrations of an aeroplane.~~ Nowadays, belt tighteners are incorporated into belt retractors, for example, of MB 500 SL in order to save costs, assembly time and space.

A second object of the present invention resides in a user-friendly belt-feeding device to ease the restraint and in a single master release button, which, when depressed, ~~to-releases~~ all latch plates from the buckle assemblies and/or returns the belt-feeding device to the home (resting) position. In emergency cases paramedics and fire-fighters can easily rescue the injured passengers.

A third object of the present invention resides in the conventional three-point seat belt associated with new parts, shown in Fig. 2, to serve as a transition product until multi-point seat belts are put into production. ~~cost, space-saving integration of the multi-point seat belt, equipped with energy absorbers, and the seat into a baby-eet, child-seat or safety seat, illustrated in Figs. 1, 23.~~

INDUSTRIAL APPLICABILITY

It should be apparent that the invention provides a-substantially improved restraint, including the following features:

a) The survival chance is enhanced by the restraint of

- * both shoulders and the torso, when the passenger is thrown forward (**Fig. 4, Table 3**) and/or subjected to the yaw $\ddot{\alpha}$ -acceleration-dependent torque T_{δ} , and
- * both thighs and the lower body-part of the body to prevent, ~~when the passenger-~~ submarining (**Fig. 12b**).

b) Because the belt retractor is attached to one belt end, a number of sets of vibration-dampening energy absorbers ref. to US serial no. 09/554,464 (WO 99/24292,

(PCT/DE98/03271, European Patent EP 1 037 771 B1, German Patent DE 197 58 498 C2, CA pending US and CA patent 2,314,345) or German Patent DE 197 58 497 C2 can be

attached to the other belt end (**Figs. 112a, 112b, 158**), thus gradually absorbing large impact energy below the respective injury-related values. The inventor of the present application has submitted those patent documents and applications to CIPO as well as

USPTO. The vibration-dampening energy absorber consists of a number of clamping elements, having sites of predetermined fracture, and a retaining element, which, fastened to the seat-backrest frame and/or seat-cushion frame, can serve as an integral part thereof.

c) Owing to the different positions of pairs of upper buckle assemblies, in plug-in connection with the respective belt-detachable latch plates **25 (Fig. 16)**, passengers of different body proportions can adjust the belts by themselves. Moreover, the seats, equipped therewith, can be modified to be used by adults or children, thus increasing the rate of seat occupancy in a bus, train or an aeroplane, exemplified in **Fig. 203**.

~~e) In another embodiment an upper belt deflector 5b (Fig. 15), in plug-in connection with the buckle assembly 4, or the buckle assembly 4 is height-adjustable. Energy absorbers, above-mentioned, can be connected to this buckle assembly. Upon the use of the height-adjustable belt deflector 5b the height-adjustable D-ring 12, attached to the B-, C-, D-post section (pillar, pillar portion), shown in Fig. 1, or to the top edge of the seat backrest, is no longer needed. When the belt deflector 5b is not height-adjustable, it can be connected to energy absorbers which absorb energy and dampen vibration when the first shoulder belt portion moves it up.~~

~~d) In another embodiment the upper belt deflector 5a (Fig. 13) can be rigidly attached to the head rest 3.6a. Any adjustment of the height of the head rest 3.6a to the head automatically~~

adjusts the height of the upper belt deflector to the shoulder. This feature differs from the D-ring ref. to DE 40 10 452 A1, which is in contact with the shoulder belt, when the passenger is thrown forward, and is moved up to intercept the head, when thrown backward.

- 5 d) In resting position the shoulder latch plate 2, in plug-in connection with an assisting buckle assembly 16, 16a, 16b, fastened to the seat cushion 3.1, B-, C-post section or seat backrest (Figs. 1, 2), is easily accessed by the passenger having the intention wanting to use the belt.
- 10 e) The seat belt can be equipped with a belt-feeding device, manually operated or by a drive apparatus, for example, hydraulic-piston cylinder unit, electrical motor (not drawn), which enhances the convenience and comfort of the user. This drive apparatus is switched on by a pressure sensor, built to the seat, or an existing switch such as lighting-, door- or touching switch. If the belt is not engaged within a dwell time, a control device is activated to switch off the drive apparatus and to reposition the belt-feeding device in the resting position.
- 15 f) For the convenience of the passenger, when stepping out, or for the quick-rescue of the injured passenger, ~~when being rescued~~ in accidents, the master release button 84 of the buckle assembly 9.1 is depressed to release all latch plates from the buckle assemblies and/or to return the belt-feeding device to the resting (home) position.
- 20 h) ~~The round rollover tubes 20.2b of the seat backrest frame 3.4d are designed to guide the belt housing 20.4c, 20.4d (Figs. 18, 19), to act as safety bars in a rollover and to allow free view to the rear owing to openings 97R, 97L (Fig. 23).~~
- 25 i) ~~In another embodiment the seat belt can be connected to the seat in more than three attachment points (Figs. 1, 12b4, 203), in which both thighs (femurs) are restrained, thus protecting the passenger from submarining in a front, rear collision or rollover or when in sleeping position. Unlike the suspender (waist-) belt, consisting of several belts, the portions of multi-point seat belt need not be adjusted in length, when the circumference of the passenger varies depending on the clothes worn.~~

BRIEF DESCRIPTION OF THE DRAWINGS

30 A number of embodiments, other advantages and features of the present invention will be described in the accompanying tables and drawings with reference to the xyz global coordinate system:

Table 1 shows test data such as left / right thigh-force, belt force and pitch-angle of driver and co-driver in 50% offset crash test of several European vehicles at crash speed of 55 km/h.

Table 2 shows yaw angle O of driver / co-driver in a 50% offset crash tests.

Table 3 shows test data of the safest child-restraint system Chico Shuttle® at the converted velocity of 55 km/h in comparison with the safest vehicle among them listed in **Table 1.**

DESCRIPTION OF THE PREFERRED EMBODIMENTS OF THE INVENTION

The advantages of the preferred embodiments in the Chap. "INDUSTRIAL APPLICABILITY" are outlined hereinafter with regard to the functions and features thereof.

5 The method of the present invention capitalizes on the premise that a seat belt is employed to restrain a passenger in at least four attachment points of the seat to distribute all acceleration dependant loads, particularly the yaw \ddot{O} -acceleration-dependent torque T_δ , thereto in an accident, thus ensuring the operation of a single belt retractor to pre-tension (bias) as well as tension the belt, restraining both shoulders, upper- and lower body-part of the
10 body and lowering all the loads, in particular, in co-operation with the energy-absorption when a number of sets of vibration-dampening energy absorbers is put into use. This will be apparent when all forces, imposed on the belted passenger, shown in Figs. 3 and 4, are formulated in the event of a front collision, where the loads of the mass D_s of the torso are lowered because

- 15 – the forward motion „ w_v ” is minimized, thus substantially reducing the pitch-acceleration \ddot{U}_H and force F_{Hy} of the mass D_H of the head, and
- the yaw-acceleration \ddot{O} is minimized, thus substantially reducing the torque T_δ , imposed on the head. Great torque T_δ is the most latent force, responsible for sudden death.

To a great extent massive head injuries can be avoided.

20 Load case I in z-y plane: The rotating mass D_s rotates about the rotating axis „S” at the pitch-angle U_s and mass D_H about the rotating axis „z” at the pitch-angle U_H in Table 1, thereby resulting in the pitch-accelerations \ddot{U}_s , \ddot{U}_H and rotating forces F_{sy} , F_{Hy} . The addition of both rotating forces yields the force F_v linked to the forward motion w_v of passenger, shown in

25 Fig. 4.

~~In front and/or rear collision the passenger is exposed to the submarining force S_y , shown in Fig. 14.~~

30 Load case II in x-y plane: The upper body-part of body is subjected to the torque T_δ , exerted by the yaw-acceleration \ddot{O} about the rotating axis „z”. When the upper body-part is restrained in an X-shape, the torque is substituted by a pair of forces.

Load case III in x-z plane: The rotating mass D_S rotates about the rotating axis „S” at the rotating angle U_y and mass D_H about the rotating axis „z” at the rotating angle U_{Hy} , thereby resulting in the rotating accelerations \ddot{U}_y , \ddot{U}_{Hy} and rotating forces D_{Sy} , D_{Hy} (not drawn). In a rollover-accident the passenger is subjected to the load F_{Sz} .

Load case IV: In turbulence-related vibrations of an aeroplane the load D_{Sy} together with D_{Hy} takes the form of periodical load $\pm F_{Hx}$, F_{Sz} of $\pm F_{Sz}$, T_δ of $\pm T_\delta$, S_y of $\pm S_y$ and F_{Sy} together with F_{Hy} of $\pm F_v$.

The restraint system, illustrated in Fig. 1, is provided with a conventional belt retractor 13 having a clamping device, housed in the B-, C-, D-post section or in the seat backrest 3.2 at one of both seat-sides SL and SR of a seat backrest 3.2 and connected to the second belt end EL. The ~~other~~ first belt end ER is provided with a shoulder latch plate 2, which is retained, loosely guided by a lower belt deflector 17, fastened to the vehicle floor, and inserted into one of the upper buckle assemblies 4, 4a to 4c, 14, 14a, 18, 18a, 18b, arranged in or to the seat backrest 3.2. In all embodiments ~~an additional~~ main latch plate 9 can move along the seat belt 1 between both belt ends EL and ER. When plug-in connecting the shoulder latch plate 2 (in the direction of arrow "Z") to the buckle assembly 4 and the main latch plate 9 to the main buckle assembly 9.1, an X-shaped restraint of the upper body-part of body and both shoulders as well as a restraint of the lower body-part of body are accomplished by the both first and second shoulder belt portions 1.1, 1.2 and the lap belt portion 1.3.

In the 2nd embodiment, shown in Fig. 2, a transition product, comprising a conventional three-point seat belt 1e and new parts, has to be invented due to the delay in producing ~~resulting from the production of~~ multi-point seat belts 1. The floor fitting (not shown) is replaced by the lower belt deflector 17. The first belt end of the lower first shoulder belt portion 1.11 is provided with transition latch plate 2. The first belt end of an upper first shoulder belt 1.12 and the ~~other~~ second belt end are equipped with a transition buckle assembly 4e, having a transition release button 84c, and with a second belt retractor 13a, arranged in the seat backrest 3.2. Due to the second belt retractor the transition buckle assembly 4e, acting as the shoulder latch plate 2, 2a of multi-point seat belt, is located in a home position on a seat-backrest aperture of the seat at the first seat-side. Hence, the seat-design is not compromised. In a coupling position The restraint in an X-shape is defined by plug-in connection of transition latch plate 2 with the transition buckle assembly 4e, pulled out

from the seat-backrest aperture, wherethrough a transition portion of the upper first shoulder belt is projected. This transition portion and the lower first shoulder belt portion 1.11 define the first shoulder belt portion 1.1. In order to resolve the above-mentioned drawback D1, the spring force of the second belt retractor 13a, to retract the upper first shoulder belt 1.12, released by on-depressing the transition release button 84c, is far less than that of the belt retractor 13. ~~Although~~ Despite the circumference of the restrained passenger varies, varying depending on the clothes worn, and the seating-position differs different seat position the lower first shoulder belt portion 1.11 always projects through the lower belt deflector 17 at a sufficient length of "l₁" in order to maintain the function of the belt retractor 13 to retract, to block the belt as well as to release the retracted belt during the journey travel and the function of the belt tightener (not drawn), incorporated in the belt retractor, to forcefully retract (withdraw) and tighten the belt in an accident. The transition release button 84c of transition buckle assembly 4e, arranged to or in the seat, can be controlled neither by release cable 4.2 nor by electrical release-motor 4.2b. Hence, the release button 84c. It can only be activated by electrical signals emitted from the master release button 84 when depressed when depressing the master release button 84.

The other second belt end of upper first shoulder belt 1.12 can be connected either to a coupling fitting 1.2a, 1.2b (Figs. 112a, 112b, 185, 19) or to the second belt retractor 13a (belt retractor 13 shown in Fig. 18) having a coupling fitting 1.2b (Fig. 15) in order to receive a number of vibration-dampening energy absorbers to dissipate great impact energy and dampen strong vibration.

In another embodiment the an upper first shoulder belt 1.12a consists of the transition buckle assembly 4e and a shoulder latch plate 2a (not shown), similar to latch plate 2 (Fig. 1), which is plug-in connected to

- the upper buckle assembly 4, 4a to 4c, 14, 14a, 18, 18a, 18b, 18.1 to 18.3, arranged in to the seat backrest, in operation position or
- the assisting buckle assembly 16, 16a, 16b in resting position.

When motor vehicles are already licensed, modification of different seats and three-point seat belts can easily be accomplished by arrangement of at least one buckle assembly, of the lower belt deflector 17, of the second belt retractor 13a and by a variety of one-piece, detachable, upper first shoulder belts 1.12a with different lengths. Furthermore, the latch plate 2a can be detached from the buckle assembly by depressing the master release button 84.

A first shoulder belt portion 1.1 is defined by the upper first shoulder belt ~~1.12, 1.12a~~ and the lower first shoulder belt portion 1.11.

~~At With an expensive modification or at in new transport system the convenience and comfort are enhanced by the use of belt-feeding device 20, 20a to 20d enhances the convenience and~~
5 ~~comfort, where the upper first shoulder belt 1.12, 1.12a having with transition buckle assembly 4e is a part thereof the belt-feeding device.~~

~~Evidently Beyond doubt, the three-point seat belt 1e in plug-in connection with the upper first shoulder belt 1.12, 1.12a serves suited as a temporary transition-solution for the multi-point seat belt 1, 1a to 1d during the production.~~

10 In the above-mentioned embodiments to resolve the above-mentioned drawback ~~D34~~ the upper body-part of body is restrained by extending the shoulder belt portions crosswise in an X-shape

c1) when at least one shoulder latch plate 2 is plug-in connected to the upper buckle assembly of the seat backrest; or

15 c2) when a shoulder latch plate 2, arranged to the first belt end ER of the first shoulder belt portion 1.1 of a belt-feeding device 20a, 20b, is plug-in connected to the upper buckle assembly of the seat backrest; ~~or.~~

~~e3) when the belt-feeding device 20, 20c, 20d positions the first shoulder belt portion 1.1, the belt-end ER of which is arranged to or in the side SR of the seat backrest, from the~~
20 ~~operation position to a resting position.~~

These features ref. to c2) and e3) have the advantage that the common practise of operating to operate the conventional three-point seat belt is preserved.

In order to resolve the above-mentioned drawbacks ~~D2~~ and ~~D45~~ great energy is absorbed and strong vibration is dampened by a large number of vibration-dampening energy absorbers
25 connected to the respective upper buckle assemblies 4, 4a to 4c, 4e, 7, 8, 8a to 8d, 9.1, 14, 14a, 15, 15a, 18, 18a, 18b, 18.1 to 18.3, 19, 19a, 19b, 19.1 to 19.3 (Figs. 1, 14, ~~1920, 23~~) into which latch plates are ~~inserted~~ plug-in connected.

~~As shown in Figs. 1 and 14, the seat belt 1 is equipped with an anti-submarining latch plate 11, which can be connected to one of the buckle assemblies 7, 8, 8a to 8d, arranged in or to~~
30 ~~the seat frame 3.3. When plug-in connected, the lap belt portion 1.3 is subdivided into two belt portions 1.3R, 1.3L. Owing to the restraint of both thighs the submarining problem in~~

front or rear collision, in rollover or turbulence-related vibration of an aeroplane is resolved. Moreover, the passenger, lying in a sleeping position, is well protected.

Because the reel (spool) of the conventional belt retractor can accommodate only a limited length of belt, it is possible that the length of the seat belt for the sleeping position is insufficient. As exemplified in Fig. 1, a buckle assembly 8b, 8c is provided with a release button 84c and a length-adjustable belt, fastened to the seat frame, for the purpose of compensating the length of seat belt 1 between the sleeping and normal position.

A buckle assembly 8d, provided with a release button 84d, is attached to the front portion of the seat cushion.

Owing to the plug-in connection of the anti-submarining latch plate 11, 25 with one of the buckle assemblies a lady in a long gown as well as a child are well protected from submarining (Fig. 23).

The lower belt deflector 17 comprises a housing having an attachment hole to receive a pin 17.1. Both members can be made in one piece. If necessary, the pin 17.1 is surrounded by a sleeve 17.2 of plastics, having corrugation or knobs, which is a common part of the conventional D-ring 12. This D-ring 12 can be replaced by the lower belt deflector 17. The aperture of the belt deflector 17 to loosely guide the belt portion is dimensioned so as to such a size to retain the latch plate 2 in resting position, thus allowing the use as a three-point seat belt.

In the 1st embodiment ref. to Figs. 14, 17a, 17d the belt-feeding device 20 in resting position is provided with a device to countersink the belt-feeding plate 20.9 in the seat backrest to improve the overall impression of the seat design, whereon the sales success depends.

When the passenger takes his seat, a drive apparatus, being activated,

— moves up over the head rest the belt-feeding plate 20.9 (Fig. 17a) and then the guide tube 20.1 with the operating arm 20.2, whose belt ring 20.8 houses and loosely guides the first belt portion 1.1 (Fig. 17b);

— rotates the operating arm and the first shoulder belt portion over the head rest, his head and in front of the upper part of his body 95 at „ β ” (Fig. 14), where in a contact position a key of the operating arm projects through a receptacle of the belt-feeding plate 20.9 or a clamping receptacle 20.11 of the belt-feeding plate 20.9a (Figs. 17c, e, f), and

countersinks the belt feeding plate 20.9 or 20.9a and the guide tube 20.1 with the operating arm 20.2 until reaching the operating position in which the first shoulder belt portion extends across over the upper part of his body and the drive apparatus is switched off (Fig. 17d).

To prevent the entanglement of the first shoulder belt portion 1.1 behind the seat, particularly when positioned furthest forward, that first shoulder belt portion 1.1 in resting position is intercepted by the belt-catching member 20.7, 20.7a (Figs. 12a4, 17a, 172b). When the second shoulder belt portion 1.2 and the extending belt portion 1.4 are arranged to the post section, both shoulder belt portions can also be intercepted by the belt-catching member.

When the seat 3c (Fig. 203) has a high seat backrest, the curved guide tube 20.1 of belt-feeding devices 20a (Fig. 135) can be modified in to a straight-running operating arm 20.2 of the belt-feeding device 20.

In the 2nd or 3rd embodiment the belt-feeding device 20a or 20b is provided with a height-adjustable belt housing 20.4a and radial-adjustable tube 20.3 (Figs. 153, 164). Both devices differ from each other by the position of the guide tubes 20.1 on the seat backrest. Each guide tube can be driven by a drive apparatus, housed in the seat backrest. The guide tube 20.1 of the belt-feeding device 20a is pivotally attached in a stiff supporting tube 3.61 of the height-adjustable head rest 3.6a.

The height of „ Δh ” of belt housing 20.4a, having a latch plate 2, plug-in connected to any buckle assembly 4, 14, 18, is adjustable when the passenger moves two openings, facing each other, along the operating arm 20.2a. Alternatively, the passenger can move a handle 5.2, such as locking handle 27.5 of the height- and width-adjusting mechanism 27, 27a (Figs. 135, 179 to 1922), to adjust the height of „ Δh ” of the upper-shoulder-belt deflector 5b.

In order to ensure the operation of pro- and retracting any shoulder-belt portion, arranged in the seat backrest (Figs. 8 to 10), is loosely guided by a shoulder-belt deflector which, having a rectangular shape, is usually pressed in a seat-backrest aperture of the seat backrest on the top edge.

The belt-feeding devices 20a, 20b have to meet the following criteria:

- Passengers can freely get in and out of the vehicle compartment thanks to the distances of „a” and „b” between the post section 91 and operating arm 20.2a (Fig. 164) in resting position; and

- the device, when moved, ~~does not~~doesn't interfere with the head rest 3.6a, height-adjustable about „ Δh_k ”, and with the head of the passenger with/without hat 92.

Regarding the kinematics of the height-adjustable belt housing 20.4a with the latch plate 2 from the ~~operating~~operative position to the resting position, the trajectories of „Ba2” and „Bb” are well clear of the passenger's head not in the range of a hat thanks to a radial-adjustable tube 20.3 incorporated into the operating arm 20.2a. Without the radial-adjustable tube 20.3 the operating arm in the trajectory of „Ba1” would interferes with that hat.

~~In the 4th and 5th embodiment ref. to Figs. 18, 19 the belt feeding devices 20c, 20d differ from each other by the rotatory movement of the operating arm 20.2, whose guide tube 20.1 is pivotally attached to a bearing casing 20.10. Preferably, upon the rotation about the head, the translatory and rotatory movement of belt are synchronised.~~

~~To form the upper part of the seat backrest frame 3.4d a pair of angle fittings 26a, a pair of rollover tubes 20.2b and a pair of side girders 27.1a or four tubes 27.1 (not drawn) are form and/or force locking connected to each other by connecting pins 26.2, 26.3 (drawn with dotted lines) and/or by welding, bolting, glueing and/or riveting. The belt housing 20.4c or 20.4d, having a moveable safety bracket 20.6, is guided by rollover tubes 20.2b and driven by an electrical motor 20.5 along the threaded spindle 20.1a, fastened to both angle fittings 26a, from the resting position (drawn with dotted lines) to the operating position, and back again. In the operating position the holes of the rollover tube 20.2b and belt housing 20.4d are aligned with each other, thus permitting the legs of the safety bracket 20.6, loaded in the event of rollover of a convertible, roadster or sport utility vehicle, to project therethrough and clamp or jam the first shoulder belt portion 1.1.~~

Upon plug-in connection of the latch plate 2 with the buckle assembly 4, 4a, 4b the belt end ER of belt portion 1.1 is connected to the coupling fitting 1.2a, 1.2b (Figs. 121a, 121b), whereto a number of energy absorbers is attached to absorb energy. In a cost-saving embodiment without the latch plate 2 and buckle assembly, the belt end ER of belt portion 1.1 is directly connected to the coupling fitting 1.2a or 1.2b (Fig. 185) to receive energy absorbers, the retaining elements of which are fastened to the seat backrest frame 3.4d. In order to absorb great energy and damp strong vibration in the event during in-flight turbulence-related vibrations of an aeroplane or in the accident of a fast speeding car or high-speed train, the belt retractor 13, coupling fitting 1.2b of which is connected to energy absorbers, is moveably attached to the oblong holes of a stiff plate 13.3, fastened to the seat-

backrest frame ~~in at~~ the seat-side SR so that the other belt end EL can be exploited to receive additional energy absorbers. In excess of threshold value the belt retractor pulls the clamping elements along the respective retaining elements to absorb energy and damp vibration.

In the 1st ~~and 2nd~~ to 3rd embodiment (Figs. 121a, 11b, 218) the buckle assembly 4a, 4b, 4c is form- and/or force-locking connected to the seat-backrest-frame of the seat.

For the convenience of the passenger when egressing from the vehicle and in cases of emergency the following embodiments of detachment are proposed:

To disconnect the latch plates 2, 11 and/or 25 from the buckle assemblies 4, 14, 14a, 15, 15a (Fig. 1) and pairs of supplement upper buckle assemblies 18 / 19, 18a / 19a, 18b / 19b, 18.1 / 19.1 to 18.3 / 19.3, 19, 19a, 19b, 19.1 to 19.3 (Fig. 203) of the seat arrangement, particularly for children, as well as from the anti-submarining buckle assemblies 7, 8, 8a to 8d (Figs. 1, 142b), the master release button 84, when depressed, activates the release cables 4.2 and/or electrical release-motors 4.2b, which pull the release button 84a and/or 84b of the buckle assemblies (Figs. 112a, 112b, 218).

When depressing the master release button 84 the drive apparatus of the belt-feeding device 20, 20a, ~~to 20d~~ returns the first shoulder belt portion 1.1 from the operating-operative position to the resting position.

~~According to the traffic or flight law during the travel or turbulence-related flight passengers must remain belted. The need for a belted mother becomes apparent, when she must take care of her frightened children seating on the rear seat. The separately operated release button 84c, 84d, when depressed, detaches only the latch plates 11, 25 of the lap belt portion from the assemblies 7, 8, 8a, 8d (Figs. 1, 23) to annul the protection from submarining.~~

In the 1st embodiment (Figs. 197 to 219) the height- and width-adjusting mechanism 27 comprises a frame 29, buckle-assembly unit 18.3, 19.3, a pair of tubes 27.4, members 27.5 to 27.9 and a pair of tubes 27.1 having a plurality of vertical locking slots, in form- and force-locking connection with an angle fitting 26a. The frame 29 consists of a pair of outer tubes 27.3, a pair of tubes 27.2 and a connecting member of all tubes. The locking handle 27.5 is form- and force-locking connected to the slots of the inner tubes 27.4.

These inner tubes 27.4, inserted into the outer tubes 27.3, are pre-loaded by the tube-springs 27.6. Each tube-spring 27.6 on a sleeve 27.7, secured by pin 27.8, protruding through the holes of the inner tube 27.4, presses against the spring rest 27.9 of the outer tube 27.3.

The locking handle 27.5 is in engagement with a pair of vertical locking slots of tubes 27.1.

5 The locking handle 27.5, when pulled out from both slots, is detached therefrom. The height of mechanism 27 and buckle assembly can be adjusted

The outer tube 27.3 is provided with a plurality of horizontal locking slots q, r, s etc., drawn with dotted lines, shown in **Figs. 1720, 1922.**

10 After the pawl 18.10, pre-loaded by the pawl-spring 18.5, is detached from the horizontal locking slot r by its movement in the direction of arrow (**Fig. 218**), the housing 18.12 of the buckle-assembly unit 18.3, 19.3, form-locking connected to the upper buckle assembly 4c thereof, can be moved along both outer tubes 27.3.

15 Belt-detachable U-shaped latch plates 25 offer the passengers a feature to adapt their body proportions to the appropriate attachment points pair of supplement upper buckle assemblies into which the latch plates 25 are inserted (**Figs. 169, 203**). Any belt portion, such as 1.1, 1.2, is loosely guided thereby, secured by a quick-release pin 25.1 thereof and detached therefrom by pulling the quick-release pin. To adapt a small body proportion of, say, a child, far lower than the upper buckle assembly 4 suited for adults, at least one pair of belt-detachable latch
20 plates 25 are plug-in connected to one of the pairs of supplemental upper buckle assemblies 18 / 19, 18a / 19a, 18b / 19b, 18.1 / 19.1 to 18.3 / 19.3, arranged to the seat backrest at the first and second seat-side (Figs. 1 and 20). For safety reasons and easy access the belt-detachable latch plates 25, when not being used, are stored and secured in a storage box 25.5 of the seat (Fig. 20).

25 For juxtaposed seats in vehicles, buses, trains and aeroplanes it is recommended to use a single locking handle 27.5 to operate the 2nd embodiment of the height- and width-adjusting mechanism 27a of each seat 3c, having, for example, three pairs of openings 18.1 / 19.1 to 18.3 / 19.3 to receive a pair of shoulder latch plates (**Figs. 1922, 203**).

30 The frame 29a consists of two pairs of outer tubes 27.3, two pairs of tubes 27.2, a pair of connecting members of all tubes and members 18.3, 19.3, 27.6 to 27.9a, 27.11, attached to the outer tubes 27.3.

The locking handle 27.5 is form- and force-locking connected to slots of the inner tubes 27.4 by the pins 27.12. After inserting these inner tubes into the outer tubes 27.3 the locking plate

27.10 is form- and force-locking connected to the slots of the inner tubes and to the pins 27.12.

After securing the spring rest 27.9a by the retaining rings 27.11, and both sleeves 27.7a by the pins 27.8, protruding through the holes of inner tubes 27.4 and oblong holes of outer tubes 27.3, the inner tubes with locking handle 27.5 are pre-loaded by tube-springs 27.6. The locking handle 27.5, when pulled out from both slots, is detached therefrom. The height of height- and width-adjusting mechanism 27a can be adjusted.

Although the present invention has been described and illustrated in detail, it is clearly understood that the terminology used is intended to describe rather than limit. Many more objects, embodiments, features and variations of the present invention are possible in light of the above-mentioned teachings. Therefore, within the spirit and scope of the appended claims, the present invention may be practised otherwise than as specifically described and illustrated.

What is claimed:

Claims 2 to 5, 22 to 25, 27 to 31 and 39 to 41 (cancelled)

Claim 1. (currently amended) A multi-point seat belt ~~for increasing survival chance for~~ of a passenger ~~of a transport system in the event of an accident of a transport system or during or in-flight turbulence-related vibrations of an aeroplane~~, comprising

a first and second shoulder belt portion, a lap belt portion and an extending belt portions (1.1 to 1.4) and ~~two~~ a first and second belt ends (ELR) and (ERL), where the extending belt portion (1.4), having ~~one the second belt end (EL) of which with the extending belt portion (1.4)~~, loosely guided by a ~~D-ring~~ shoulder-belt-portion deflector (5, 5b, 12) and equipped with a belt retractor (13), having a clamping device, is ~~arranged to~~ attached to a stiff ~~third vehicle body~~ transport-system member, generally representing a ~~body floor~~ of the transport system adjacent to a second seat-side or a seat-backrest frame at the second seat-side or a post section of a motor vehicle adjacent to the second seat-side or a floor (6) thereof;

a main buckle assembly (9.1) having a master release button (84), ~~adjacent to one side of the seat frame (3.3, 3.3a to 3.3d) and arranged to~~ attached to the floor (6) a stiff first transport-system member, generally representing the floor of the transport system adjacent to a first seat-side or a seat-cushion frame at the first seat-side or a mid-tunnel of a motor vehicle adjacent to the first seat-side;

at least two latch plates (2, 2a, 9, 11, 25), the first of which is a main latch plate (9), ~~moveable moveable~~ along the lap- and second shoulder belt portion, and the second is a shoulder latch plate (2, 2a) of the first belt end (ER) of the first shoulder belt portion (1.1);

a lower belt deflector (17) which, ~~adjacent to the other side of the seat frame and arranged to~~ attached to the floor (6) a stiff second transport-system member, which, generally representing the floor of the transport system adjacent to the second seat-side or the seat-cushion frame at the second seat-side or the post section of the motor vehicle adjacent to the second seat-side or a side rail of the motor vehicle adjacent to the second seat-side, deflects and loosely guides the ~~first and~~ lap belt portion (1.1, 1.3) and the first shoulder belt portion (1.1); and

at least one upper buckle assembly (4, 4b, 4c, 4e, 14, 14a, 18, 18a, 18b, 18.1 to 18.3) arranged ~~located~~ on a side (SR) of ~~the~~ seat backrest at the first seat-side;

whereby

a lower body-part of ~~his-a~~ body (96) of the passenger and an upper body-part (95) are restrained by the ~~lap-belt-portion (1.3)~~ and the second shoulder belt portion (1.2) when the main latch plate (9) is plug-in connected to the main buckle assembly (9.1); and
5 the upper body-part is restrained by the first and second shoulder belt portion, both (1.1, 1.2) extending crosswise in an X-shape when the shoulder latch plate (2, 2a), ~~fastened to the other belt end (ER) of the first shoulder belt portion (1.1)~~, is plug-in connected to the upper buckle assembly.

10 Claim 72. (currently amended) The multi-point seat belt according to claim 51, wherein the master release button (84) ~~is provided with release cables (4.2) connecting to release buttons of the buckle assemblies where the master release button~~, when depressed, releases all the latch plates from the respective buckle assemblies.

15 Claim 73. (currently amended) The multi-point seat belt according to claim 52, wherein the master release button (84) is provided with release cables (4.2) connecting to release buttons of the upper buckle assemblies ~~where the master release button, when depressed, releases all the latch plates from the respective buckle assemblies~~.

20 Claim 184. (currently amended) The multi-point seat belt according to claim 142, wherein the master release button (84) is provided with release wires connected to electrical release-motors (4.2b) of release buttons of the upper buckle assemblies ~~and a release wire connected to the drive apparatus where the master release button, when depressed, releases all the latch plates from the respective buckle assemblies and returns the belt-feeding device to the resting position~~.

25 Claim 195. (currently amended) The multi-point seat belt according to claim 1, wherein the multi-point seat belt (1, 1a to 1d) consists of a three-point seat belt (1e) and an additional upper first shoulder belt (1.12a),

~~to the a first belt end of which a transition buckle assembly (4e) is attached and a second the other belt end is~~ are provided with a transition buckle assembly (4e) and the shoulder latch plate (2a), which is plug-in connected to the upper buckle assembly; and

where

30 a transition latch plate (2) is ~~arrttang~~ attached to ~~thea~~ a first belt end of a lower first shoulder belt portion (1.11) of the three-point seat belt (1e); and

whereby

the passenger is restrained ~~by plug-in connection of when~~ the main latch plate (9) and the transition latch plate (2) are plug-in connected with to the main buckle assembly (9.1) and ~~of the transition latch plate (2) with the transition buckle assembly (4e)~~, where the lower first shoulder belt portion (1.11) projects through the lower belt deflector (17) at a sufficient length (l₁) needed for the belt retractor to retract the first shoulder belt portion, defined by the lower first shoulder belt portion and the ~~additional upper first shoulder belt~~, in a real-world ~~the~~ accident.

Claim ~~206~~. (currently amended) The multi-point seat belt according to claim ~~21~~, wherein the multi-point seat belt (1, 1a to 1d) consists of a three-point seat belt (1e) and an ~~additional upper first shoulder belt (1.12)~~,

~~to the a first belt end of which is provided with a transition buckle assembly (4e), which, having a transition release button (84c) and acting as the upper buckle assembly (4), in a home position is located on a seat-backrest aperture of the seat backrest at the first seat-side attached and the other a second belt end is arranged in to the side (SR) of the seat-backrest frame at the first seat-side; and~~

where

a transition latch plate (2) is ~~arrt~~attached to ~~thea~~ first belt end of a lower first shoulder belt portion (1.11) of the three-point seat belt (1e); ~~and~~

whereby

in a coupling position the passenger is restrained ~~by plug-in connection of when~~ the main latch plate (9) and the transition latch plate (2) are plug-in connected with to the main buckle assembly (9.1) and ~~of the transition latch plate (2) with the transition buckle assembly (4e)~~, pulled out from the seat-backrest aperture, wherethrough a transition portion of the upper first shoulder belt is projected, where the lower first shoulder belt portion (1.11) projects through the lower belt deflector (17) at a sufficient length (l₁) needed for the belt retractor to retract the first shoulder belt portion, defined by the lower first shoulder belt portion and ~~the transition portionthe additional shoulder belt~~, in a real-world ~~the~~ accident.

Claim ~~217~~. (currently amended) The multi-point seat belt according to claim ~~206~~, wherein the ~~other second belt end of the additional upper first shoulder belt (1.12)~~ is provided with a

second belt retractor (13a), which, arranged in the side (SR) of the seat backrest (3.2) at the first seat-side, has a spring force, which is less than that of the belt retractor (13), whereby

in the coupling position the belt retractor pulls the upper first shoulder belt out from the second belt retractor through the seat-backrest aperture or in the home position the transition buckle assembly (4e), released by depressing the transition release button, is pulled by the second belt retractor until being located on the seat-backrest aperture.

Claim 8. (new) The multi-point seat belt according to claim 7, wherein the transition buckle assembly is provided with an electrical release-motor (4.2b), which, when receiving an electrical signal from the main buckle assembly resulting from depressing the main release button releasing the main latch plate, pulls the transition release button to release the transition latch plate.

Claim 89. (currently amended) The multi-point seat belt according to claim 71, wherein the lower belt deflector (17) comprises a housing, having an attachment hole, and a pin (17.1), attached in the housing to form an aperture which loosely retains the released shoulder latch plate (2, 2a) when released.

Claim 910. (original) The multi-point seat belt according to claim 89, wherein the pin (17.1) is surrounded by a sleeve (17.2).

Claim 101. (original) The multi-point seat belt according to claim 910, wherein the lower belt deflector (17) is made of one piece.

Claim 112. (currently amended) The multi-point seat belt according to claim 82, wherein the passenger, intending to use the multi-point seat belt, easily accesses the released shoulder latch plate when being plug-in connected to an assisting buckle assembly (16, 16a, 16b) which, having an easily-accessible release button, is and arranged to attached to the a seat, where the passenger, wanting to use the multi-point seat belt, easily accesses the shoulder latch plate, which is released by depressing the easily-accessible release button.

Claim 123. (currently amended) The multi-point seat belt according to claim 82, wherein the passenger, intending to use the multi-point seat belt, easily accesses the released shoulder latch plate when being plug-in connected to an assisting buckle assembly (16, 16a, 16b) which,

having an easily-accessible release button, is and arranged to attached to the post section,
where the passenger, wanting to use the multi-point seat belt, easily accesses the shoulder
latch plate, which is released by depressing the easily-accessible release button.

Claim 134. (currently amended) The multi-point seat belt according to claim 12, ~~further~~
~~comprising wherein~~ a belt-feeding device (20a, 20b) ~~consisting consists of~~
a belt housing (20.4a) ~~equipped with to which~~ the shoulder latch plate (2, 2a) of the first
shoulder belt portion (1.1) is attached; and
an operating arm (20.2a), to a first one-end of which ~~is connected the belt housing and a~~
~~second the other end is~~ are connected to the belt housing and a guide tube (20.1), pivotally
attached in a supporting tube of the seat backrest;
whereby the shoulder latch plate (2, 2a) is inserted into and connected to the upper buckle
assembly (4, 14, 18) and the first shoulder belt portion is moved from a resting position at the
second seat-side to an operativeng position at the first seat-side by a rotatory movement of the
operating arm.

Claim 145. (currently amended) The multi-point seat belt according to claim 514, ~~further~~
~~comprising wherein a the~~ belt-feeding device (20a, 20b) ~~consisting of is~~ provided with at least
one drive apparatus to rotate the operating arm, where the shoulder latch plate (2, 2a) is
inserted into and connected to the upper buckle assembly (4, 14, 18) and the first shoulder belt
portion is moved from the resting position at the second seat-side to the operative position at
the first seat-side by a rotatory movement of the operating arm when the drive apparatus is
activated.

~~a belt housing (20.4a) equipped with the shoulder latch plate (2) of the first shoulder belt~~
~~portion (1.1);~~
~~an operating arm (20.2a), to one end of which is connected the belt housing and the other~~
~~end is connected to a guide tube (20.1) pivotally attached in a supporting tube (3.61) of a~~
~~head rest (3.6a); and~~
~~at least one drive apparatus to rotate the operating arm with the belt housing;~~
~~whereby the shoulder latch plate (2) is inserted into and connected to the upper buckle~~
~~assembly (4, 14, 18) and the first shoulder belt portion is moved from the resting position to~~
~~the operating position by rotatory movement of the operating arm when the drive apparatus is~~
~~activated.~~

Claim 16. (currently amended) The multi-point seat belt according to claim 145, wherein the operating arm (20.2a) consists of and the belt housing have
a ~~vehorizontieal~~ horizontal portion, to an end of which the guide tube is fastened; and
a vertical portion, an end of which is fastened to the belt housing, having a vertical tube with
5 ~~which, having~~ two openings, facing each other, which is movable ~~moveable~~ along the
vertical portion to adjust ~~thea~~ height of the belt housing.

Claim 17. (currently amended) The multi-point seat belt according to claim 146, wherein ~~the~~
~~operating arm (20.2a)~~ is a radial-adjustable tube (20.3) is attached between the horizontal
portion and the guide tube, where the first shoulder belt portion is moved from the resting
10 position to the ~~operatingve~~ operating position by a radial-adjusting movement of the radial-adjustable
tube when the drive apparatus is activated.

Claim ~~37~~18. (currently amended) The multi-point seat belt according to claim ~~31~~15, wherein
the drive apparatus is operable to return the first shoulder belt portion (1.1) from the
operativeng position to the resting position, when a dwell time, predetermined for an
15 engagement of the key with the receptacle, is exceeded.

Claim 152. (currently amended) The multi-point seat belt according to claim 145, wherein
the drive apparatus returns the first shoulder belt portion (1.1) from the ~~operating~~ operative
position to the resting position, when a dwell time, predetermined for insertieng of the
shoulder latch plate (2, 2a) into the upper buckle assembly (4, 4a to 4c, 14, 14a, 18), is
20 exceeded.

Claim ~~33~~20. (currently amended) The multi-point seat belt according to claim ~~31~~15, wherein
the drive apparatus, activated in response to activating a switch, attached in the main buckle
assembly (9.1), upon contact with a cam of the main latch plate (9), when inserted therein, is
switched off when the ~~operatingve~~ operating position is reached.

Claim ~~34~~21. (currently amended) The multi-point seat belt according to claim ~~31~~15, wherein
the drive apparatus, activated in response to starting an engine of the transport system, is
switched off when the ~~operatingve~~ operating position is reached.

Claim ~~35~~22. (currently amended) The multi-point seat belt according to claim ~~31~~15, wherein
the drive apparatus, activated in response to closing a vehicle door of the transport system, is
30 switched off when the ~~operativeng~~ operating position is reached.

Claim ~~203~~. (currently amended) The multi-point seat belt according to claim ~~3115~~, wherein the drive apparatus, activated in response to actuating a switch, is switched off when the operatingve position is reached.

Claim ~~3624~~. (currently amended) The multi-point seat belt according to claim ~~3115~~, wherein the drive apparatus is activated when the passenger takes ~~his~~ a seat, whereto a ~~pressure~~-sensor is built, where the drive apparatus is switched off when the operativeng position is reached.

Claim ~~3825~~. (currently amended) The multi-point seat belt according to claim ~~3115~~, wherein the drive apparatus, activated in response to depressing x-times the master release button (~~84~~), is switched off when the operativeng position is reached.

Claim ~~1826~~. (currently amended) The multi-point seat belt according to claim ~~145~~, wherein the master release button (~~84~~) is provided with
release wires connecteding to electrical release-motors (~~4.2b~~) of release buttons of the upper buckle assemblies and
a release wire connecteding to the drive apparatus
where the master release button, when depressed, releases all the latch plates from the respective buckle assemblies and returns the belt-feeding device to the resting position.

Claim ~~4327~~. (currently amended) The multi-point seat belt according to claim 1, wherein the supplemental latch plate is a belt-detachable latch plate (25), which has a quick-release pin (~~25.1~~) and a U-shaped portion to house the belt portion of the seat belt which is secured therein by the quick-release pin and detached therefrom by pulling it.

Claim ~~28~~. (new) The multi-point seat belt according to claim 27, wherein the seat backrest at the second seat-side is provided with supplemental upper buckle assemblies (19, 19a, 19b, 19.1 to 19.3), which together with the corresponding supplemental upper buckle assemblies at the first seat-side define the pairs of supplemental upper buckle assemblies (18 / 19, 18a / 19a, 18b / 19b, 18.1 / 19.1 to 18.3 / 19.3),
one of which is adapted to a small body proportion of the passenger, lower than the upper buckle assembly, and,
finally, the belt-detachable latch plates, housing both shoulder belt portions, are plug-in connected to that pair.

Claim 29. (new) The multi-point seat belt according to claim 28, wherein the belt-detachable latch plates, when not being used, are stored and secured in a storage box (25.5) of the seat.

Claim 2630. (currently amended) The multi-point seat belt according to claim 248, wherein the belt end (~~ER~~) of the first shoulder belt portion (1.1) buckle assembly is provided with a coupling fitting (1.2a, 1.2b) to receive energy absorbers.

Claim 4231. (original) The multi-point seat belt according to claim 4015, wherein a belt-catching member (20.7, 20.7a) is attached to the seat backrest to intercept and hold at least one shoulder belt portion when being in the resting position.

Claim 632. (currently amended) The multi-point seat belt according to claim 12, further comprising a height- and width-adjusting mechanism (27) consisting of
a pair of tubes (27.1) of a seat backrest frame (3.4d) having a plurality of vertical locking slots, one pair of which is engaged with a locking handle (27.5), that can be pulled to detach therefrom and released to engage, when a height of a body proportion of the passenger is adjusted;
a frame (29) consisting of a pair of outer frame-tubes (27.2), ~~movable~~moveable along the inner frame-tubes (27.1), a connecting member of all frame-tubes (27.2, 27.3) and a pair of outer tubes (27.3), in which inner tubes (27.4) are ~~movable~~moveable, biased by ~~tube~~tube-springs (27.6) and form- and force-locking connected to the locking handle (27.5), where the ~~tube~~tube-spring (27.6) on a sleeve (27.7), secured by a pin (27.8), protruding through holes of the inner tube (27.4), presses against a spring rest (27.9 of the outer tube (27.3);
a plurality of horizontal locking slots arranged along one of the outer tubes (27.3); and
at least one buckle-assembly unit (18.3, 19.3), consisting of an upper buckle assembly (4c), to connect to the shoulder latch plate, and a housing (18.12), form-locking connected to the upper buckle assembly, ~~movable~~moveable along the outer tubes (27.3) and secured by a pawl (18.10) biased by a pawl-spring (18.5), engaged with the horizontal locking slot (r) and detached therefrom by pulling the pawl to adjust to a width of ~~theis~~ body proportion.
